

DOE X533 Closure Update:

The OVEC area load was previously served from two 345 kV substations owned, operated, and maintained by the DOE. Each DOE station was integrated with the OVEC system by two double-circuit tower 345 kV lines and with neighboring systems by one single-circuit 345 kV line. The DOE "X533" station and all connected transmission lines were removed from service in November 2008 at the request of DOE. The DOE X533 station shutdown is permanent. Removal of the associated 345 kV transmission lines from the substation has been completed as of May 2009. Completion of their reconfiguration outside of the substation site is scheduled to be completed in late 2009.
